iPad Recipe Saving Issues

Issue: QuickDraw iPad app will crash when trying to save an edited recipe with a different name.

Versions Affected: iPad Version 1.04.00 and earlier (iPad Version information is on Operations screen)

If you try to edit a recipe on the iPad app and change the Mix Name, the app will crash when Save is pressed.

You can edit a recipe without changing the name, and the edited recipe will save correctly.

You can create a new recipe using the Duplicate feature with the following steps:

1. Select Recipe > New > Duplicate > choose the recipe you want to use > change the Mix Name using the keyboard. After changing the name, hit DONE to lower the keyboard. This will keep the new name. If you don't lower the keyboard before you enter other information, the name will revert to the original name. > Make the other changes to the recipe. > Save
2. This newly created recipe will show up in your recipe list in blue (New, Not Saved in Controller).

This issue will be fixed in the next QuickDraw iPad app release.
